Crewmatic Dashboard — Product Specification v1.0

For: Lakshman
From: Brett
Date: April 13, 2026

This document defines the Dashboard — the first screen techs and owners see when they log into Crewmatic. It provides a real-time picture of all active jobs and surfaces anything that needs attention that day.

Purpose

The Dashboard is **mission control** for the restoration crew. It answers: - Where are my jobs today? (Live Map) - What do I need to do? (Task Feed) - What needs my attention? (Alerts) - How many hours have I worked? (Time Clock) - What's the team saying? (Team Chat)

Everything is designed for **speed** — techs in the field should be able to glance at this screen and know exactly what they need to do next.

Screen Layout

└──────────────────────────────────────────────────────────────────────────
────────┘
```

Note: If Time Clock is disabled, that card is removed and the map expands to fill the space.

Mobile View

Same components, stacked vertically: 1. Time Clock (if enabled — always at top, single tap to clock in/out) 2. Alerts (if any exist) 3. Map/Dispatch toggle 4. Tasks 5. Team Chat

If Time Clock is disabled, the list starts with Alerts.

Component Details

1. Live Job Map

What it shows: - Map of your service area with **custom icons** for every active job - Icon type indicates job type: - 💧 **Water droplet** = Water damage job - 🔥 **Flame** = Fire damage job - 🦠 **Mold spore** = Mold remediation job - 🔨 **Hammer/wrench** = Reconstruction job - Icon color indicates job status: - **Blue** = Active (work in progress right now) - **Amber** = Pending (scheduled but not started) - **Green** = Completed (finished, awaiting invoice/payment) - **Red** = Needs attention (overdue tasks or alerts)

Visual differentiation features:

Pulsing animation for active jobs: - Icons for jobs with crew on-site right now pulse slowly - Shows at a glance which jobs have techs working

Map interactions: - Click icon → Opens job detail in side panel (or navigates to Job Detail Page on mobile) - Hover over icon → Shows quick info card: 💧 `123 Main St  Water Damage - Day 3  Brett assigned  Next task: Moisture reading (due today)` - Zoom in/out to see all jobs or focus on specific area - Double-click icon → Jumps directly to Job Detail Page (power user shortcut)

Map style: - Use dark mode map (gray/black background, lighter roads) - Makes the colorful job icons pop visually - Less eye strain for all-day dashboard viewing - Light mode option available in settings

Toggle: Map View ↔ Dispatch View

Same card, two modes — toggle button at top switches between them.

1A. Dispatch View (Alternative to Map)

When you toggle to Dispatch View, shows:

```
┌──────────────────────────────────────────────────────────────────────────────┐
│  DISPATCH - Today (Monday, April 14)                                         │
├──────────────────────────────────────────────────────────────────────────────┤
│                                                                              │
│  Brett                                          📍 3 jobs                    │
│  ────────────────────────────────────────────────────────────────────────────│
│                                                                              │
│  • 123 Main St - Moisture reading due                                        │
│  • 456 Oak St - Equipment check                                              │
│  • 789 Elm Ave - Final walkthrough                                           │
│                                                                              │
│  Tech 1                                         📍 2 jobs                    │
│  ────────────────────────────────────────────────────────────────────────────│
```

```
│
│   • 321 Pine Dr - Equipment setup                                  │
│   • 654 Maple Ln - Demo work                                       │
│                                                                     │
│   🔔 Tomorrow's Needs:                                              │
│   • Thornwood basement - Need more dehumidifiers (Brett)           │
│   • Oak St - Cabinet delivery expected (Tech 1)                    │
│                                                                     │
└─────────────────────────────────────────────────────────────────────┘
```

Dispatch View shows: - All crew members - Jobs assigned to each tech for today - Flagged items from previous check-ins (e.g., "Need more equipment") - Tomorrow's needs (auto-surfaces from crew input)

How tomorrow's needs get flagged: - Techs add notes during job check-ins: "Need 2 more dehumidifiers tomorrow" - System parses notes for tomorrow-related keywords - Surfaces them in Dispatch View under "Tomorrow's Needs"

Why Map vs. Dispatch? - **Map** = Spatial view ("where are my jobs?") - **Dispatch** = Task view ("what does each tech need to do today?") - Toggle lets owner/dispatcher see whichever view is most useful at that moment

---

2. Task Feed

What it shows: - All tasks across all jobs assigned to the logged-in tech - Badge colors indicate urgency: - **Red** = Overdue - **Amber** = Due today - **Green** = Completed

Task card format:

```
┌──────────────────────────────────────────┐
│  🔴 Take moisture reading                │
│     123 Main St - Kitchen                │
│     Overdue by 2 days                    │
│     [View Job]                           │
└──────────────────────────────────────────┘
```

Tap behavior: - Tap task → Navigates directly to the relevant job - Auto-scrolls to the section where that task lives (e.g., Moisture Readings tab)

How tasks are generated:

Auto-generated from system events: - Moisture reading due (based on last reading + 24-hour interval) - Equipment check due (based on deployment date + scheduled check interval) - Final walkthrough scheduled (based on job status = Completed)

Manually created by crew: - During job check-in, tech adds note: "Check subfloor tomorrow" - System creates task assigned to that tech

Task states: - **Pending** → Shows in amber or red (depending on due date) - **Completed** → Shows in green, auto-archives after 24 hours

---

3. Alerts

What it shows: - System-generated alerts that require attention - Always visible if any exist - Sorted by urgency (red alerts first, then amber)

Alert types:

🔴 **Red alerts (urgent):** - Moisture readings out of range (above dry threshold for 3+ days) - Overdue drying logs (no reading in 48+ hours) - Equipment malfunction reported

🟠 **Amber alerts (informational):** - Supplement approval from carrier (money approved) - Supplement denial from carrier (needs action) - Equipment delivery scheduled - Final walkthrough scheduled

Alert card format:

```
┌──────────────────────────────────────────────────────────┐
│  🔴 Moisture reading overdue - 123 Main St (2 days)      │
│     Kitchen reading has not been updated since 4/12      │
│     [View Job]  [Mark Resolved]                          │
└──────────────────────────────────────────────────────────┘
```

Tap behavior: - Tap alert → Links directly to relevant job - "Mark Resolved" → Dismisses alert (if action was taken outside system)

Alerts disappear when: - The condition is resolved (e.g., moisture reading is taken) - Tech marks as resolved manually - Alert expires (e.g., supplement approval alert auto-dismisses after 7 days)

---

4. Time Clock (Optional — Owner Configurable)

This feature can be enabled or disabled by the owner in Settings.

Why make it optional: - Some contractors pay hourly and need time tracking - Others pay salary or per-job and don't need it - Contractors using external payroll systems may not want duplicate tracking - Keeps dashboard clean for those who don't use it

When enabled, shows:

When clocked out:

```
┌──────────────────────────┐
│  Time Clock              │
│                          │
│  ⏰ Clocked Out          │
```

```
│                          │
│  Today: 0 hrs            │
│  Week:  25.5 hrs         │
│                          │
│  [Clock In]              │
│                          │
└──────────────────────────┘
```

When clocked in:

```
┌──────────────────────────┐
│  Time Clock              │
│                          │
│  ⏰ Clocked In           │
│                          │
│  Today: 6.5 hrs          │
│  Week:  32 hrs           │
│                          │
│  [Clock Out]             │
│                          │
│  Session Log:            │
│  8:00 AM - now           │
│  12:30 PM - 1:00 PM      │
│                          │
└──────────────────────────┘
```

Clock In/Out behavior:

Single button — one tap: - If clocked out → Taps "Clock In" - If clocked in → Taps "Clock Out" - No restrictions on frequency (techs can clock in/out multiple times per day)

What happens on clock event: - Timestamp recorded - GPS coordinates captured passively (not shown to tech, available for owner if needed) - Today's hours recalculated in real-time - Week's hours updated

Session Log: - Shows each clock-in/clock-out segment for today - Format: `8:00 AM - 12:30 PM` (3.5 hrs) - If currently clocked in, shows: `8:00 AM - now` - Auto-collapses to just show today (expandable to see previous days if needed)

Weekly hours calculation: - Starts Monday, ends Sunday - Resets to 0 on Monday morning - Shows running total throughout the week

Why GPS is captured: - Available for job costing (which jobs did tech work on today?) - Available for audit/compliance if needed - NOT surfaced to tech (not a tracking/surveillance tool) - Owner can view if needed, but it's passive background data

---

5. Team Chat

What it shows: - Single flat crew chat feed - Visible to all team members (Brett, Tech 1, Tech 2, etc.) - NOT job-specific — techs add job context naturally in their messages

Chat format:

```
┌──────────────────────────────────────────┐
│ 💬 Team Chat                             │
│ ──────────────────────────────────────── │
│                                          │
│ Brett (2:15 PM):                         │
│ Thornwood basement still needs           │
│ another day. Moisture at 16%.            │
│                                          │
│ Tech 1 (1:45 PM):                        │
│ Running low on dehumidifiers.            │
│ Can we grab 2 more from Jon-Don?         │
│                                          │
│ Brett (1:30 PM):                         │
│ Good work on Oak St demo. Cabinet        │
│ delivery tomorrow at 9 AM.               │
│                                          │
│ [Type message here...]                   │
│ [Send]                                   │
│                                          │
└──────────────────────────────────────────┘
```

Message structure: - Sender name + timestamp - Message text (plain text, no formatting for now) - Newest messages at bottom (like SMS) - Auto-scrolls to newest message when new message arrives

Input field: - Simple text box at bottom - Tap to type - Enter/Send button posts message immediately - No file attachments in V1 (text only)

Why this is separate from job-specific communication: - Team chat = internal crew coordination - Job notes/comments = customer-facing or insurance documentation - Keeps casual crew banter separate from formal job records

NOT visible to: - Homeowners - Insurance adjusters - PA portal users - This is internal crew only

---

User Roles & Permissions

All Users See All Jobs (With Visual Emphasis)

Everyone sees the full map — all active jobs are visible to all crew members.

Why this matters: - Crew can help each other (Tech 1 running late? Tech 2 can cover nearby job) - Emergency flexibility (nearest tech can grab urgent call) - Context awareness (everyone knows what the team is doing) - Learning (new techs see examples of different job types)

Visual differentiation for "Your Jobs" vs "Other Jobs":

Your assigned jobs: - **Larger icons** (48px instead of 32px) - **Brighter colors** (full saturation) - **Subtle glow/shadow** around the icon - Stand out visually on the map

Other crew's jobs: - **Standard size** (32px) - **Slightly muted colors** (80% opacity) - **No glow** - Visible but not distracting

Example visual:

```
Your job:      💧  ← 48px, bright blue, subtle glow
              (🔵)

Other's job:   💧  ← 32px, muted blue, no glow
              (🔵)
```

Toggle option (top right of map): - "Show All Jobs" (default) - "Show My Jobs Only" (hides other crew's jobs)

This gives techs focus when they need it, but keeps full visibility available.

Owners (Brett)

Additional capabilities: - See time clock data for all crew members (not just own) - Assign/reassign jobs to different techs - Override task assignments

Techs (Tech 1, Tech 2, etc.)

Standard capabilities: - See all jobs on map (with visual emphasis on their assigned jobs) - See only tasks assigned to them in Task Feed - See only alerts for their assigned jobs - See only their own time clock data - Full access to Team Chat

---

Mobile Optimizations

Time Clock

- **Huge button** at top of screen (thumb-friendly)
- Single tap to clock in/out
- GPS captured silently (no permission prompt every time)

Map View

- Defaults to showing all jobs (with visual emphasis on yours)
- Toggle in top corner: "All Jobs" / "My Jobs Only"
- Pinch to zoom

- Tap icon → Opens job detail (full screen on mobile, not side panel)
- Your assigned jobs are larger and brighter (easy to spot)

Dispatch View

- Collapsible crew sections (tap to expand/collapse)
- Shows only logged-in tech's jobs by default
- Owner can expand to see all techs

Task Feed

- Swipe task right → Mark complete
- Tap task → Navigate to job
- Red badge count on Dashboard tab if overdue tasks exist

Team Chat

- Sticky input field at bottom (doesn't scroll away)
- Push notifications for new messages (if enabled)
- Badge count on Dashboard tab if unread messages

Real-Time Updates

Dashboard should refresh automatically when: - New task is created (appears in Task Feed immediately) - Alert condition is met (appears in Alerts immediately) - Crew member posts in Team Chat (message appears for all users) - Job status changes (map pin color updates) - Tech clocks in/out (time clock updates for owner view)

How often to refresh: - Task Feed: Every 60 seconds - Alerts: Every 30 seconds - Team Chat: Real-time (websocket or polling every 5 seconds) - Map: Every 2 minutes - Time Clock: Real-time (updates as clock runs)

What Happens When You Click Things

Map Pin

- **Desktop:** Opens job detail in side panel (slide-out from right)
- **Mobile:** Navigates to full-screen Job Detail Page

Dispatch View Job

- Tap job name → Navigates to Job Detail Page

Task Card

- Tap task → Navigates to Job Detail Page, auto-scrolls to relevant section
- Example: "Take moisture reading" → Opens job, scrolls to Moisture Readings tab

Alert Card

- Tap alert → Navigates to Job Detail Page
- "Mark Resolved" → Dismisses alert without navigating

Team Chat Message

- Tap message → Does nothing (just text, no links)
- Future: Could auto-detect job addresses and make them tappable links

---

└──────────────────────────────────────┘
```

Visual Design Notes

Custom Map Icons

Icon design requirements:

Water Droplet (💧): - Simple, clean water droplet shape - Solid fill (no gradients) for clarity at small sizes - Should be recognizable at 24px × 24px minimum

Flame (🔥): - Stylized flame shape (not realistic fire) - Could be single flame or 2-3 flames grouped - Sharp, angular edges to differentiate from rounded water droplet

Mold Spore (🦠): - Circular with spiky/irregular edges (like a microscopic organism) - Could have small dots/texture inside - Distinct silhouette that doesn't look like other icons

Reconstruction Hammer (🔨): - Simple hammer or crossed hammer + wrench icon - Clean lines, no excessive detail - Construction/building theme clearly communicated

Status color overlays: - Icons have base white/light gray fill - Colored circle background indicates status: - Blue circle = Active - Amber circle = Pending - Green circle = Completed - Red circle = Needs attention - Circle pulses slowly if job is active (crew on-site)

Icon sizing: - Default: 32px × 32px - Zoomed out (cluster view): 24px × 24px - Zoomed in (detail view): 48px × 48px - Needs attention (red): 40px × 40px (slightly larger to draw eye)

Example visual structure:

```
  🔥   ← White/light gray flame icon
 (🟠) ← Amber circle background (pending status)
```

Color Coding (Consistent Across All Components)

Status colors: - 🔴 Red = Urgent/Overdue - 🟠 Amber = Due today/Pending - 🟢 Green = Completed/Good - 🔵 Blue = Active/In progress

Use these colors for: - Map pins - Task badges - Alert icons - Time clock status

Component Spacing

- Dashboard should feel **scannable** — use whitespace generously
- Each component (Map, Tasks, Alerts, Chat, Time Clock) has clear visual separation
- Cards should have subtle shadows or borders

Typography

- **Bold** for section headers (Tasks, Alerts, Team Chat)
- **Regular weight** for content
- **Small gray text** for timestamps and secondary info

Success Criteria

This screen is done when:

1. I can see all my active jobs on a map
2. I can toggle between Map and Dispatch view
3. I can see all my tasks at a glance (overdue ones are red)
4. I can tap a task and go straight to that job
5. Alerts show up when moisture readings are overdue
6. I can clock in/out with one tap

7. Today's hours and weekly hours update in real-time
8. Team chat lets me post messages visible to whole crew
9. Everything auto-refreshes (don't need to manually reload)
10. Mobile view works smoothly (big buttons, easy to read)

What Comes Next

After Dashboard works: - Job Detail Page is fully functional (already specced) - Status Management (moving jobs through lifecycle) - Voice + Photo documentation workflow (mobile capture) - Estimate Builder (creating estimates from jobs)

What Makes This Map Different from Competitors

Most field service software has boring maps — generic pins, no context, feels like Google Maps with dots.

Crewmatic's map should feel alive:

1. Job Type Icons (Not Generic Pins)

- Instant visual differentiation — you can see at a glance you have 3 water jobs, 1 fire job
- Competitors use identical pins, maybe with different colors
- Our icons tell a story: 💧🔥🦠🔨

2. Pulsing Active Jobs

- Shows which jobs have crew on-site RIGHT NOW
- Creates sense of real-time activity
- Competitors show static pins (you can't tell what's happening)

3. Dark Mode Map

- Reduces eye strain for all-day dashboard use
- Makes colorful icons pop dramatically
- Most competitors use standard light maps (washed out, boring)

4. Quick Hover Cards

- See job status, assigned tech, next task WITHOUT clicking
- Faster decision-making (do I need to visit this job today?)
- Competitors require click → open detail page → read → back

5. Needs Attention (Red Icons)

- Jobs with overdue tasks or alerts automatically show in red
- Draws the eye immediately to what needs action
- Competitors bury alerts in separate lists (easy to miss)

The goal: When Brett opens the dashboard, he should know in 3 seconds: - Where are my jobs? - Which ones need my attention? - What's my crew doing right now?

The map is the **hero element** of the dashboard. It should feel premium, polished, and purpose-built for restoration contractors — not a generic map widget.

Settings & Configuration (Owner Only)

Time Clock Feature Toggle

Location: Settings > Team > Time Clock

Options: - **Enabled** (default for new accounts) - Time clock card appears on Dashboard for all users - Techs can clock in/out - Owner can view all crew time data - GPS coordinates captured passively

- **Disabled**
  - Time clock card is hidden from Dashboard
  - No time tracking occurs
  - Frees up screen space on Dashboard
  - Recommended for: Salary employees, per-job payment, or contractors using external time tracking

Note: This setting applies to the entire company. Individual techs cannot enable/disable for themselves.

If disabled mid-use: - Historical time data is preserved (can be exported if needed) - Time clock card disappears from Dashboard - Can be re-enabled at any time (data resumes, no loss)
